***Allowable Subject Matter***

Claims 1,3-5 and 22 are allowed.

The following is an examiner's statement of reasons for allowance:

Independent claims 1 and 22 have been amended to incorporate claims that were objected to.

The closest prior art of record, Fishman (6084869) teaches a method of selecting a time to receive. Benveniste (2004/0264397) teaches a subscriber transmitting to an access point a temporal period. Liu (7245946) teaches a subscriber periodically wake up at schedule time to receive beacons.

However, Fishman in view of Benveniste further in view of Liu fail to teach all of the combined features of:

Claim 1. A method for use by a subscriber unit to select a time to receive a transmission from a wireless local area network access point using a shared wireless communication resource, comprising:

- receiving a beacon transmission from the access point comprising first information that corresponds to times when other subscriber units are proposing to utilize the shared wireless communication resource, wherein receiving a beacon transmission comprises receiving the beacon transmission at a scheduled time;
- using the first information to select a particular time to receive data from the access point using the shared wireless communication resource
- transmitting the selected particular time;

- determining that the transmission at the selected particular time was not received by the access point; and
- selecting a new time to permit reception of data from the access point using the shared wireless communication resource including;
- receiving another beacon transmission from the access point comprising second information that corresponds to times when other subscriber units are proposing to utilize the shared wireless communication resource; and
- using the second information to select a new particular time to receive data from the access point using the shared wireless communication resource.

Claim 22. A subscriber unit for use with a wireless local area network access point using a shared wireless communication resource, comprising:

- a shared wireless communication resource compatible transceiver;  
a controller having at least an active mode of operation and a sleep mode of operation and being operably coupled to the transceiver;
- a memory operably coupled to the controller having, at least from time to time, stored therein:  
- a plurality of proposed times received from the access point at which other subscriber units have proposed to utilize the shared wireless communication resource, wherein the

proposed times are part of a regularly scheduled beacon transmission from the access point;

- a first scheduled time at which the controller will shift from the sleep mode of operation to the active mode of operation;

- a second scheduled time at which the controller will cause the transceiver to receive data as transmitted by the access point;

wherein the controller comprises scheduling means for using the plurality of proposed times to select the first and second scheduled times, for causing transmission of the data to the access point at the second scheduled time when there is no proposed time, and for further selecting another scheduled time when an apparent conflict appears to exist with another subscriber unit at the second scheduled time.

Thus the cited prior art alone or in combination does not fairly suggest or disclose the claimed combination of features.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
